- Clustering: the process of partitioning a group of data points into a small number of clusters e.g. clustering movies by genre
- The k-means clustering algorithm classifies 'n'
 points into 'k' clusters by assigning each point to
 the cluster whose average value on a set of p
 variables is nearest to it
- Behavioral segmentation, Inventory categorization, Detecting anomalies etc...

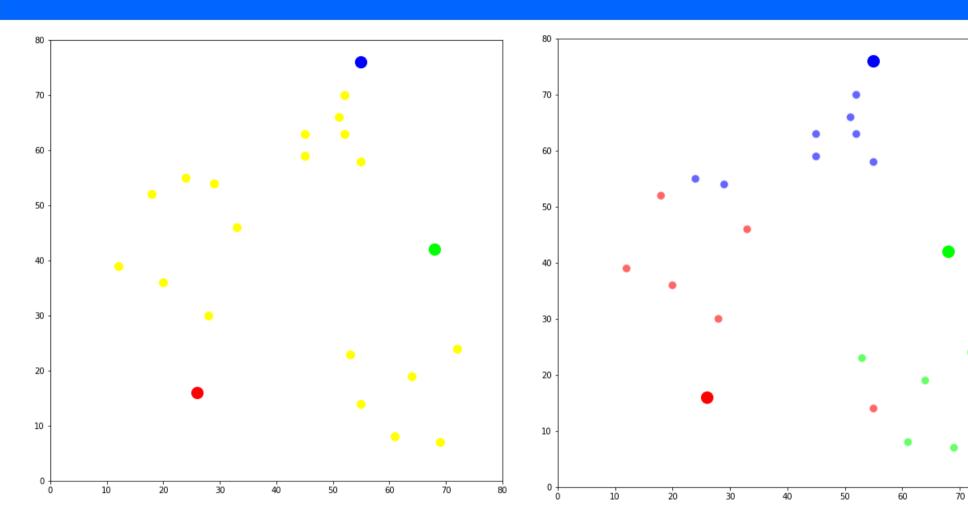

CSE 5449 (Fall 2018) 45 / 1

K-means Algorithm

- 1.Randomly select 'k' cluster centers
- Calculate the distance between each data point and cluster centers
- 3.Assign the data point to the cluster center whose distance from the cluster center is minimum of all the cluster centers
- 4.Recalculate the new cluster
- Recalculate the distance between each data point and new obtained cluster center
- 6.Repeat until no data point was reassigned

CSE 5449 (Fall 2018) 49 / 5

- Let's concentrate on computing the distance between the cluster center and the points
- Let's assume that distance metric is euclidean distance

$$distance = \sqrt{\sum_{i=1}^{D} (K_i - P_i)^2}$$

- We can ignore square root
- How do we implement this using a GPU

CSE 5449 (Fall 2018) 50 / 5

- We can assign each point to each thread.
- For a given point each thread would compute the distance between K centers
- Can we use matrix multiplication to solve this problem?

CSE 5449 (Fall 2018) 51 / 55

$$distance = \sum_{i=1}^{D} (K_i - P_i)^2$$

Lets expand the above formula (we ignored sqrt)

$$distance = \sum_{i=1}^{D} K_i^2 + P_i^2 - 2K_i * P_i$$

• How can we compute the first term $\sum_{i=1}^{\infty} \sum_{j=1}^{\infty} x_j = 1$

$$\sum_{i=1}^{D} K_i^2$$

- How can we compute the first term? $\sum_{i=1}^{D} K_i^2$
- This is a simple dot product
- Does the first term change across iterations?
- We can compute the second term similarly $\sum_{i=1}^{\infty} P_i^2$
- Does the second term change across iterations?

CSE 5449 (Fall 2018) 53 / 1

What about the third term

$$\sum_{i=1}^{D} -2K_i * P_i$$

 Let K_i^J represent the the ith dimension of jth point. The notation for P is similar

$$P = \begin{bmatrix} p_1^1 & p_2^1 & p_3^1 & \dots & p_D^1 \\ p_1^2 & p_2^2 & p_3^2 & \dots & p_D^2 \\ \dots & & & & & \\ p_1^N & p_2^N & p_3^N & \dots & p_D^N \end{bmatrix} \qquad C^T = \begin{bmatrix} c_1^1 & c_2^1 & c_3^1 & \dots & c_K^1 \\ c_1^2 & c_2^2 & c_3^2 & \dots & c_K^2 \\ \dots & & & & \\ c_1^D & c_2^D & c_3^D & \dots & c_K^D \end{bmatrix}$$

$$C^{T} = \begin{bmatrix} c_{1}^{1} & c_{2}^{1} & c_{3}^{1} & \dots & c_{K}^{1} \\ c_{1}^{2} & c_{2}^{2} & c_{3}^{2} & \dots & c_{K}^{2} \\ \dots & & & & & \\ c_{1}^{D} & c_{2}^{D} & c_{3}^{D} & \dots & c_{K}^{D} \end{bmatrix}$$

Compute P*C^T

- Now for each row take the minimum of P*C to find the cluster id
- After the above step we know the new cluster id's of each point
- How do we compute the cluster center? (does this problem look similar to what we done before)
